United States Patent Office.

SAMUEL B. FAY, OF FRANKLIN, PENNSYLVANIA.

Letters Patent No. 64,088, dated April 23, 1867.

TICKET FASTENER.

The Schedule referred to in these Letters Patent and making part of the same.

TO ALL WHOM IT MAY CONCERN:

Be it known that I, SAMUEL B. FAY, of Franklin, in the county of Venango, and State of Pennsylvania, have invented a new and improved Ticket Fastener; and I do hereby declare that the following is a full, clear, and exact description thereof, reference being had to the accompanying drawings, and to the letters of reference marked thereon, forming a part of this specification.

The nature of my invention consists in providing a loop made of wire for the purpose of holding tags or tickets to fine fabrics to supply the place of pins, which have heretofore been used for that purpose, and which injure the fabrics to a greater or less extent by perforations. By my invention this injurious mode of securing tags or tickets is obviated by making a loop or clasp of wire that springs over the surface of the ticket and goods, holding the ticket firm to the goods. My invention is especially adapted to securing tickets to silks, lace, and all the finer class of goods, without injury or leaving the slightest trace upon the goods when removed.

To enable others skilled in the art to make and use my invention, I will proceed to describe its construction and operation.

Figure I represents a piece of goods with the plan of attaching the tickets.

Figure II is a transverse section of a piece of goods, showing a larger tag or ticket secured by the fastener. Letters of like name and kind refer to like parts in each of the figures.

A represents a piece of goods or fabric of a fine quality, or it may represent paper. B represents any number of tickets of different sizes, made of paper or other suitable material used for memoranda of various kinds upon the finer fabrics or class of goods on which it would be injurious to secure the tickets by means of pins in consequence of perforations. To remedy and obviate this injury to this class of goods, I take steel or other suitable wire and bend it round so as to form a loop at one end, or a bifurcated bar, the legs of which are then twisted or turned to cross each other, thus forming a spring clasp, as shown at D, which will hold the ticket and fabric firmly together.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—
The loop wires D, twisted and crossing each other for the purpose described, as a new article of manufacture.

SAMUEL B. FAY.
